

# Status of the Large Hadron Collider

Philippe Lebrun CERN, Geneva, Switzerland

All-Russian Particle Physics Community Meeting IHEP Protvino, 22 December 2008

# Advanced technology at work

23 km of superconducting magnets cooled in superfluid helium at 1.9 K

![](_page_3_Picture_0.jpeg)

![](_page_3_Figure_1.jpeg)

![](_page_4_Picture_0.jpeg)

![](_page_4_Picture_1.jpeg)

# Main parameters of LHC (p-p)

Circumference	26.7	km
Beam energy at collision	7	TeV
Beam energy at injection	0.45	TeV
Dipole field at 7 TeV	8.33	Т
Luminosity	<b>10</b> <sup>34</sup>	cm <sup>-2</sup> .s <sup>-1</sup>
Beam current	0.56	A
<ul> <li>Protons per bunch</li> </ul>	$1.1 \times 10^{11}$	
<ul> <li>Number of bunches</li> </ul>	2808	
<ul> <li>Nominal bunch spacing</li> </ul>	24.95	ns
Normalized emittance	3.75	μm
Total crossing angle	300	μ <b>rad</b>
Energy loss per turn	6.7	keV
Critical synchrotron energy	44.1	eV
Radiated power per beam	3.8	kW
<ul> <li>Stored energy per beam</li> </ul>	350	MJ
<ul> <li>Stored energy in magnets</li> </ul>	11	GJ
Operating temperature	1.9	К

### Detection of resistive zones by He II calorimetry Methodology

![](_page_49_Picture_2.jpeg)

![](_page_49_Figure_3.jpeg)

- 1. Assessment of the baseline slope (remaining CV opening mismatch w/r to static HL)
- 2. Assessment of the temperature increase during powering plateau
- 3. Assessment of the internal energy variation (J/kg)
- 4. Assessment of the deposited energy assuming a mass of 26 l/m of LHeII

![](_page_50_Picture_0.jpeg)

#### Detection of resistive zones by He II calorimetry Experimental validation

![](_page_50_Picture_2.jpeg)

![](_page_50_Figure_3.jpeg)

![](_page_51_Picture_0.jpeg)

#### Detection of resistive zones by He II calorimetry Experimental validation

![](_page_51_Picture_2.jpeg)

	Before heating	With heating			
∆U [J/kg]	-1.1 78				
M [kg]	82	23			
∆U [k]]	-0.92	64.2			
t [s]	2880	6600			
W [W]	-0.3	9.7			
∆ <b>₩ [₩]</b>	10.0				

→ The power variation calculated by He II calorimetry is 10.0 W, corresponding to the applied electrical power
 → The method is validated and able to resolve ~ W

![](_page_52_Picture_0.jpeg)

### Calorimetry during 15R1 powering @ 5000A

![](_page_52_Picture_2.jpeg)

![](_page_52_Figure_3.jpeg)

![](_page_53_Picture_0.jpeg)

# The 15R1 case: additional heat dissipation due to a bad splice

![](_page_53_Picture_2.jpeg)

Current	Total (m	easured)	Nominal Splices*	Add. local dissipation	Uncertainty
[ <b>A</b> ]	[mW/m]	[ <b>W</b> ]	[ <b>W</b> ]	[ <b>W</b> ]	[ <b>W</b> ]
3000	4.4	1.0	0.4	0.6	0.6
5000	14.9	3.2	1.1	2.1	0.6
7000	32.2	6.9	2.1	4.8	0.6

\*: Calculated on the basis of 0.33 nW per splice and verified with the 5000 A plateaus

![](_page_53_Figure_5.jpeg)

![](_page_53_Picture_6.jpeg)

→ Local resistance: ~90 nohms confirmed by electrical measurement !

 $\rightarrow$  Nominal dissipation 13 W: OK w/r to the cooling loop capacity margin

![](_page_54_Picture_0.jpeg)
